

COIT13230 Assessment item – 1

Project Proposal and Individual Learning Plan

Due date: Week 4 Monday (3 Aug 2026) 11:45 pm AEST

ASSESSMENT 1

Weighting: 25%

Part A: Group Project Proposal – 17%

Part B: Individual Reflection and Learning Plan – 8%

1. Overview

In this unit, Assessment 1 represents the **first milestone of the capstone project**. The purpose of this assessment is to support students in defining, planning, and justifying a proposed project that demonstrates the application of business analysis knowledge and skills. The assessment consists of two components: a **group-based project proposal** and an **individual learning plan**.

Students are required to form groups of **three to four members** (subject to class size) and identify a suitable **industry-based or case-based project**. Wherever possible, students are encouraged to source **real-world projects from organisations or industry contexts**, as this provides greater practical relevance and learning value.

All proposed projects must be **approved by the project facilitator** (Unit Coordinator or campus lecturer) to ensure that the project scope, complexity, and feasibility are appropriate for completion within the duration of the term.

The proposed project should demonstrate **sufficient analytical depth and complexity** to showcase business analysis techniques, while remaining realistic and achievable within the project timeline.

It is important to note that the enterprise application that you deliver meets all aspects of requirements such as functional, non-functional, and quality. To develop your enterprise application, you are allowed to choose any development environment that you have learnt in your previous units. With the recent advances in the use of **Generative AI** in the software industry, it is recommended that your project has an intelligent aspect (for example: integrate GenAI or use other AI models to provide analytics).

2. Assessment task

Part A: Group Project Proposal (17%)

This is a **group** assessment. In this assessment, you are required to develop a project proposal for the development of a **smart enterprise application**. You should come up with an original or semi-original idea, which **should have some business value**.

Working collaboratively, each group must prepare and submit a **Project Proposal** that outlines the purpose, scope, and planning of the proposed project. The proposal should clearly demonstrate **analytical thinking, conceptual understanding, and alignment between business needs and the proposed solution**.

The proposal should include the following components:

- **Project background and justification**
Description of the context, industry or organisational setting, and rationale for the project.
- **Problem statement and project objectives**
Clear articulation of the problem to be addressed and the goals the project aims to achieve.
- **Innovative aspects of the proposed solution**
Explanation of how the proposed approach offers new value, improvements, or innovative features.
- **Project scope, assumptions, and constraints**
Definition of what is included and excluded from the project, as well as key limitations or assumptions.
- **High-level requirements overview**
Identification of key functional and non-functional requirements.
- **Work decomposition**
Breakdown of major tasks and deliverables (e.g., Work Breakdown Structure or backlog structure).
- **Delivery roadmap**
A timeline of major project milestones using a project planning tool such as a **Gantt chart**.
- **Risk identification and mitigation plan**
Identification of potential project risks and strategies to manage them.
- **Quality considerations**
Explanation of how project outputs will meet quality expectations.
- **Team structure, roles, and responsibilities matrix**
Clear identification of each team member's role and responsibilities.
- **Task leads for major deliverables**
Allocation of responsibility for key project outputs.
- **Required tools and resources**
Identification of software, platforms, or resources needed to complete the project.

The proposal should demonstrate **logical planning, feasibility, and alignment between project goals, deliverables, and resources.**

Part B: Individual Reflection and Learning Plan (8%)

Each student must individually prepare and submit a **Personal Learning Plan** that reflects their professional development goals within the project.

This component focuses on **self-directed learning, professional growth, and individual accountability within a collaborative team environment.**

Students should address the following areas:

- **Personal learning goals**
Identification of key learning objectives relevant to the project and future professional development.
- **Knowledge and skills gaps**
Reflection on areas that require development in order to contribute effectively to the project.
- **Strategies for skill development**
Planned approaches for acquiring the required knowledge or skills (e.g., research, training, practice, collaboration).
- **Planned contribution to the team**
Description of how the student intends to contribute meaningfully to the group project.
- **Professional responsibility and ethical considerations**
Reflection on ethical behaviour, accountability, and professional conduct when working within a project team.

This component assesses the student's **ability to plan for personal development, demonstrate professional awareness, and actively engage in collaborative project work.**

AI Assessment Scale - AI Collaboration

You may use AI to assist with specific tasks such as drafting text, refining and evaluating your work. You must critically evaluate and modify any AI-generated content you use.

Individual and Group Contributions:

The proposal is primarily group work (12%), but individual reflections (8%) will be marked separately. All group submissions must include a clear declaration of individual contributions. If contributions vary significantly, individual marks may differ. Failure to declare contributions may result in a deduction as specified in the marking guide.

IMPORTANT NOTE

This assessment is exempt from the 72-hour submission grace period and must be submitted

by the stated due date and time. Please refer to Moodle for detailed marking criteria and submission instructions.

3. Assignment Submission

You must upload your Project Proposal and Individual Learning Plan as a **Microsoft Word document** which should include all components or sections outlined in the assessment specification.

For **Part A (Group Project Proposal)**, all group members must upload **the same final version of the proposal**.

For **Part B (Individual Learning Plan)**, each student must submit **their own individual document reflecting their personal learning goals and contributions**.

The report must clearly indicate the details of each member of the group (Student ID and Full name).

4. Teamwork

Exclusion from teamwork can be sought in special circumstances and these may include:

- Personal disability
- Significant changes in family commitments
- Work related travel and inability to collaborate effectively
- Already working in an ICT industry engaging in teamwork (allowed after verifying with a reference letter.)

In any of the above cases, appropriate procedure will be followed to seek exclusion as per the Assessment Policy and Procedure.

4.1 Team management plan

By default, a team works collaboratively; with all members performing their duties timely. The team leader role should be rotated so that the team leadership is for equal length of time during the term. The team leader is responsible for coordinating team meetings, keeping minutes of meeting, and allocating tasks to each team member.

A large emphasis of this group project is to build teamwork skills by making you practice solving minor collaboration or other problems pertaining as part of teamwork. This should be reflected upon in the teamwork report describing the problems encountered during organisation, and conduction of teamwork. Each team should minimise contacts with lecturer for minor collaboration problems, as too many contacts show the ineffectiveness or inefficiency of the team for solving minor problems and will result in loss of marks.

Team should agree on two aspects:

1. product elements – tasks, sub-tasks, and project planning
2. process elements – roles, agreements for working together, meetings and communication

You should ensure task allocation is fair and democratic. If there is unevenness in workload, incorporate ways to compensate that person. As part of this you should have idea about an estimate of time required for task completion, and the complexity involved.

There can be problems due to task one of the team members not contributing, personality differences, or one of the team members have genuine problems due to personal reasons. You should analyse the situation as a team, keep an open mind, and be willing to change.

Unreasonable non-cooperation of team members should be reported in your submitted report.

Assessment Item 1 Marking criteria

Part A: Group Project Proposal (17%)

The Project Proposal and Plan will be assessed based on the following criteria:

1. Project Justification and Problem Definition (3%)
 - Clarity of problem statement
 - Strength of project rationale and business need
 - Alignment between objectives and the identified organisational issue
 - Demonstration of innovative thinking
2. Scope, Requirements and Feasibility (3%)
 - Clear definition of project scope, assumptions, and constraints
 - High-level identification of stakeholder needs
 - Evidence that the project is feasible within the term
 - Appropriate level of complexity
3. Project Planning and Structure (3%)
 - Quality and logical structure of work decomposition (WBS)
 - Deliverable roadmap (e.g., Gantt chart)
 - Clear allocation of roles and responsibilities
 - Identification of task leads
4. Risk and Quality Considerations (3%)
 - Identification of key project risks
 - Appropriateness of mitigation strategies
 - Consideration of quality management principles
5. Team Organisation and Resource Planning (3%)
 - Clear team structure and role clarity
 - Identification of required tools, technologies, and resources.
6. Professional Presentation and Communication (2%)
 - Logical organisation and structure
 - Academic writing quality
 - Correct use of Harvard referencing (where applicable)
 - Professional formatting and clarity

Part B: Individual Learning Plan (8%)

The Individual Learning Plan will be assessed based on:

1. Identification of Learning Goals (2%)
 - Clear identification of relevant technical and professional skills
 - Alignment between learning goals and project requirements.
2. Self-Assessment and Knowledge Gap Analysis (2%)
 - Insightful reflection on current competencies
 - Identification of realistic skill gaps.
3. Strategy for Skill Development (2%)
 - Practical and achievable strategies for skill improvement
 - Evidence of self-directed learning planning
4. Planned Contribution and Professional Responsibility (2%)
 - Clear explanation of intended project contributions
 - Demonstration of accountability and teamwork readiness
 - Awareness of ethical and professional considerations.

5. Appendix

This section presents information on setting standards and assessing teamwork, setting assessment specific academic integrity guidelines for programming assignments.

5.1 Academic Integrity – getting assistance and source code

This assignment is your chance to obtain the learning outcomes as given under objectives. It is important that you develop skills and deeper understanding of the concepts. You are permitted to use certain resources for completing this assignment as given in the table below. Use of resources outside of what is listed below will be a hurdle in your learning and required development of skills.

The scale of assistance students can get is clearly marked based on the students' level of mastery and expected learning at various levels.

You can take help from online forums to clarify design ideas or specific applicability of software tools. If you are working on an industry project, you can take help from other employees to decide what tools you can use how you can configure those tools to produce the desired solution.

	Online forum	Designing, reviewing, testing,	Assistance encouraged
	Co-worker	Designing, reviewing, testing, debugging	Assistance encouraged
	Licensed software	Should verify copyright	
	Contractor or internal product	Consult manager	
	Generative AI	Consult manager
