

Capstone Project

Week Five Workshop Activities

1. Identify classes required to implement your use cases

Analyse your Level 1 use case diagram created and identify the classes required to implement the use cases.

2. Develop UML class diagram

Note: Each team member should be working out the UML class diagrams related his/her use cases.

3. Identify user data entry required and user interface components

Based on the class attributes you can decide the user input required and decide the UI components. What standards you will be following

4. Design User Interface.

What standards you will be following?

5. Identify any input that should be saved in database and the entities required.

Develop ERD as required.

6. Identify the client-server communication required and the modules for sending the data from client side and receiving data on server side.
