

Capstone Project

Week Four Workshop Activities

1. Develop System Requirements

Analyse your Level 1 use case diagram created and develop the System Requirements. Here you are converting the user's requirements into what your software application should meet. Write this down clearly.

2. Develop Functional Requirements

Analyse your System Requirements and expand them into multiple functionalities your system should provide.

Note: Each team member should be working out the functional requirements related his/her use cases.

3. Develop Non-functional Requirements

You should consider the type of system you are developing including the type of users who will be using and the data that will be stored and accessed. Understanding these aspects write down the functional requirements.

4. Define the quality standards and metrics in relation to the non-functional requirements.

5. Develop the System Architecture

Decide the type of system you are developing based on the users accessing from different locations and services provided. Develop a system architecture such client/server or peer-to-peer, or any other.
